

## CONTENT CLIPPING SERVICE

### ABSTRACT

Content clipping is provided. Upon a user selecting content within a  
5 network document to be clipped, the content is parsed for clickable images.  
Any discovered clickable images are displayed to a user. An image is  
clickable if it is enclosed in an anchor tag or other structure that indicates a  
referenced content address. Upon a user selecting one of the clickable  
10 images a bit-mapped image of the selected clickable image is stored for later  
access by the user.
